Please find below and/or attached an Office communication concerning this application or proceeding.

#### **DETAILED ACTION**

## Status of the Application

A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 6/20/2006 has been entered.

Claim(s) 1-27, 39-40, 42-54 have been cancelled. Claim(s) 28-38, 41, 55-56 are pending. Claim(s) 28 and 55 have been amended. Claim(s) 28-38, 41, 55-56 are examined herein.

Applicant's amendments to the claims have rendered the previous rejections moot. The following new rejections will now apply.

## Claim Objections

Claim(s) 41 is objected to under 37 CFR 1.75(c), as being of improper dependent form for failing to further limit the subject matter of a previous claim. Applicant is required to cancel the claim(s), or amend the claim(s) to place the claim(s) in proper dependent form, or rewrite the claim(s) in independent form. Claim 41 is dependent upon a cancelled claim.

## Claim Rejections - 35 USC § 112

The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

Claims 28-38, 41, 55-56 are rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the written description requirement. The claims contains subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor(s), at the time the application was filed, had possession of the claimed invention.

There is no support for the limitation regarding "wherein the proanthocyanidin constitutes at least 70% of an active component of the composition" in the application as originally filed.

### Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

The factual inquiries set forth in Graham vs John Deere Co., 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

- 1. Determining the scope and contents of the prior art.
- 2. Ascertaining the differences between the prior art and the claims at issue.
- 3. Resolving the level of ordinary skill in the pertinent art.
- 4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

Claim(s) 28-38, 41 and 55-56 are rejected under 35 U.S.C. 103(a) as being obvious over Kuznicki et al. (5,681,569 of record).

Kuznicki et al. discloses a composition comprising green tea solids extracted from tea material, i.e., 0.01-0.35% flavanols or catechins wherein the catechin or a mixture of two or more the catechins are catechin, epicatechin, gallocatechin, epigallocatechin gallate and epicatechin gallate (see particularly col.3 lines 20-21 and 26-28), and a pharmaceutical carrier (i.e., water). See also abstract, co1.2, lines12-14; Example I, II, and III at co1.10, and claims 1 and 5-6. Thus, the green tea composition of Kuznicki et al. inherently comprises proanthocyanidins oligomers having the formula I and II herein and/or procyanidins such as the dimers and trimers of catechin and epicatechin herein.

The inherency of the green tea compositions containing proanthocyanidins and/or procyanidins is supported by the references by Hashimoto et al. (see "FC" in PTO-1449 submitted April 30, 2004). Hashimoto et al. teach that proanthocyanidins are isolated from oolong tea (a well known green tea), and/or the flesh leaves of green teas therein, wherein proanthocyanidins can be degraded to catechin and epicatechins by hydrolysis. Most importantly the compounds identified by Hashimoto et al. in the green tea compositions are the instant compounds havin q the formula I or II (see Chart 2, the first two compounds on the top of pa qe 3257). Morimoto et al. also teach that

proanthocyanidins or procyanidins wherein proanthocyanidins can be degraded to catechins and epicatechins.

Kuznicki et al. also discloses the composition therein is therapeutically useful in improving cognitive performance (see co1.3 line 33 in particular). The therapeutic effective amount of a catechin or mixture of catechins, within the instant claim (10-100mg/kg of bodyweight of the subject), is disclosed in the Example I and III (see col. 10 lines 1-41) as shown in the calculation below:

Example III discloses that a person can consume 835 cc (835 ml) of a beverage prepared according to Example I (see co1.10 lines 40-41).

Since the water in the composition in Example I is 94.45%, the composition is aqueous solution. The density of water = 1 g/ml, thus the total amount of the composition in Example I is 835 g.

According to Example I, the effective amount of catechins (or flavanols)

 $= 835g \times 0.097\%$  (see co1.10 line 15 in particular) = 0.8099 g = 809.9 mg

OR in different calculation, according to Example I (see particularly at co1.10 lines 6 and 13-14)

the effective amount of catechins

 $= 835g \times 0.35/100 \times 29/100 = 0.8475 g = 847.5 mg.$ 

Since a standard person weight is 70 kg, the range of effective amounts of catechins is 10 mg/kg X 70 kg = 700 mq to 1000 mg/kg X 70 kg = 70,000 mg.

Thus, the effective amount of catechins as exemplified in Example I in the composition of Kuznicki et al., 809.9 mg or 847.5 mg, is within the instant claimed range.

Kuznicki et al. also discloses that catechins therein are extracted from green teas or other plants, and isolated from green tea by methods well known to those in the art (see particularly at col.4 lines 6-14). Thus, their percentage purity herein is known to significantly exceed a proportion percentage of the catechin presence in a plant, which is an inherent property of the composition of Kuznicki et al. Kuznicki et al. also discloses that catechins can be prepared by synthetic chemical method or commercially available (see col.4 lines 14-17).

However, Kuznicki et al. does not disclose a composition with at least 70% of the active component.

It would have been prima facie obvious to a person of ordinary skill in the art, at the time the claimed invention was made to have optimized the amount of active agent in the disclosed composition.

A person of ordinary skill in the art would have been motivated to make this optimization because (1) the active agent is disclosed in the composition and (2) it is obvious to optimize the amount when the general conditions are given. Therefore, one would have had a reasonable expectation of success in formulating a pharmaceutical composition comprising proanthocyanidin in at least 70% of the composition.

Generally, mere optimization of ranges will not support the patentability of subject matter encompassed by the prior art unless there is evidence indicating such

concentration or temperature is critical. "When the general conditions of a claim are disclosed in the prior art, it is not inventive to discover the optimal or workable ranges by routine experimentation. *In re Aller*, 220 F.2d 454, 456, 105 USPQ 233, 235 (CCPA 1955); see also *In re Peterson*, 315 F. 3d at 1330, 65 USPQ 2d at 1382 "The normal desire of scientists or artisans to improve upon what is already generally known provides the motivation to determine where in a disclosed set of percentage ranges is the optimum combination of percentages." MPEP 2114.04.

Claim(s) 28, 31-38, 41 and 55-56 are rejected under 35 U.S.C. 103(a) as being obvious over JP 10245342 of record.

JP 10245342 discloses a pharmaceutical composition for diminishing the toxicity in nerve cells caused by  $\beta$ -amyloid protein comprising a catechin or two or more of catechin such as epigallocatechin gallate and epicatechin gallate prescribed in effective amounts (doses) of diminishing the toxicity of  $\beta$ -amyloid protein (see particularly page 1, the 2"d paragraph; claims 1-3 at page 1; page 2 [0001], [0002]), and a pharmaceutical carrier (i.e., water). See also page 7 [0028]; page 8 [0029]. Thus, the green tea composition in JP 10245342 inherently comprises proanthocyanidins oligomers having the formula I and II herein and/or procyanidins such as the dimers and trimers of catechin and epicatechin herein since catechins are known to encompass these compounds which are known to be isolated from green tea, as discussed above based on the references by Hashimoto et al., and Morimoto et al.

JP 10245342 also discloses that catechins therein are extracted from teas or other plants, and isolated and purified by HPLC (see page 6 [0027]). Thus, their percentage purity herein is known to significantly exceed a proportion percentage of the catechin presence in a plant, and substantially pure isolated, which is an inherent property of the composition therein.

However, JP 10245342 does not disclose a composition with at least 70% of the active component.

It would have been prima facie obvious to a person of ordinary skill in the art, at the time the claimed invention was made to have optimized the amount of active agent in the disclosed composition.

A person of ordinary skill in the art would have been motivated to make this optimization because (1) the active agent is disclosed in the composition and (2) it is obvious to optimize the amount when the general conditions are given. Therefore, one would have had a reasonable expectation of success in formulating a pharmaceutical composition comprising proanthocyanidin in at least 70% of the composition.

Claim(s) 28, 31-38, 41 and 55-56 are rejected under 35 U.S.C. 103(a) as being obvious over Hashimoto et al. of record in PTO-1449 submitted April 30, 2004.

Hashimoto et al. discloses a composition comprising a catechin or two or more of catechins such as epigallocatechin and dimers and proanthocyanidins (having the formula I and II herein) and/or procyanidins such as the dimers and trimers of catechin and epicatechin in effective amounts, and a pharmaceutical carrier (i.e., water). See

abstract. Thus, the oolong tea composition in Hashimoto et al. comprises the instant compounds herein since these compounds are known to be isolated from oolong tea. Most importantly the compounds identified by Hashimoto et al. in the green tea compositions are the instant compounds having the formula I or II (see Chart 2, the first two compounds on the top of page 3257).

Hashimoto et al. also discloses that proanthocyanidins are extracted from teas or other plants, and isolated (see page 6 [0027]). Thus, their percentage purity herein is known to significantly exceed a proportion percentage of the catechin presence in a plant, and substantially pure isolated, which is an inherent property of the composition therein.

However, Hashimoto et al. does not disclose a composition with at least 70% of the active component.

It would have been prima facie obvious to a person of ordinary skill in the art, at the time the claimed invention was made to have optimized the amount of active agent in the disclosed composition.

A person of ordinary skill in the art would have been motivated to make this optimization because (1) the active agent is disclosed in the composition and (2) it is obvious to optimize the amount when the general conditions are given. Therefore, one would have had a reasonable expectation of success in formulating a pharmaceutical composition comprising proanthocyanidin in at least 70% of the composition.

Claim(s) 28, 31-38, 41 and 55-56 are rejected under 35 U.S.C. 103(a) as being obvious over Morimoto et al.(PTO-892).

Morimoto et al. discloses a composition comprising a catechin or two or more of catechins such as epigallocatechin and dimers and procyanidins (having the formula I and II herein) such as the dimers and trimers of catechin and epicatechin in effective amounts, and a pharmaceutical carrier (i.e., water). See abstract, page 908-909. Most importantly the compounds identified by Morimoto et al. are the instant compounds having the formula I or II (see page 909, Compound 3 and page 908).

However, Morimoto et al. does not disclose a composition with at least 70% of the active component.

It would have been prima facie obvious to a person of ordinary skill in the art, at the time the claimed invention was made to have optimized the amount of active agent in the disclosed composition.

A person of ordinary skill in the art would have been motivated to make this optimization because (1) the active agent is disclosed in the composition and (2) it is obvious to optimize the amount when the general conditions are given. Therefore, one would have had a reasonable expectation of success in formulating a pharmaceutical composition comprising proanthocyanidin in at least 70% of the composition.

Claim(s) 28, 31-38, 41 and 55-56 are rejected under 35 U.S.C. 103(a) as being obvious over Hatano et al. for reasons of record stated in the Office Action dated September 30, 2003.

Page 11

Hatano et al. discloses a composition for anti-HIV comprising or inherently comprising a catechin or two or more of catechins such as epigallocatechin and dimers or proanthocyanidins oligomers having the formula I and II herein and/or procyanidins such as the dimers and trimers of catechin and epicatechin in effective amounts, and a pharmaceutical carder (i.e., water). See abstract.

Thus, the composition in Hatano et al. inherently comprises the instant compounds herein since these compounds are known to be isolated from Camellia japonica plants. See abstract.

Hatano et al. also discloses that catechins therein are extracted from plants, and isolated (see page 6 [0027]). Thus, their percentage purity herein is known to significantly exceed a proportion percentage of the catechin presence in a plant, and substantially pure isolated, which is an inherent property of the composition therein.

However, Hatano et al. does not disclose a composition with at least 70% of the active component.

It would have been prima facie obvious to a person of ordinary skill in the art, at the time the claimed invention was made to have optimized the amount of active agent in the disclosed composition.

A person of ordinary skill in the art would have been motivated to make this optimization because (1) the active agent is disclosed in the composition and (2) it is obvious to optimize the amount when the general conditions are given. Therefore, one would have had a reasonable expectation of success in formulating a pharmaceutical composition comprising proanthocyanidin in at least 70% of the composition.
